Infrared Inspections for Roof
Consultants

MEMBER – RCI

Infrared Roof Surveys

CALL US FIRST – GET THE JOB DONE RIGHT!

- Moisture in a roof system can lead to deck corrosion, roof collapse, mold, insect infestation, etc.
- Wet insulation stays warm after sunset and can be seen through the camera lens as heat transfer.
- Determine what is wet or dry before you decide to repair or replace your roof system.
- Save money by keeping the existing dry insulation in place when re-roofing.

Mark J. Sobeck Roof Consulting, Inc. has performed Infrared Roof Surveys on millions of square feet of roofs throughout the Eastern U.S.

Can't find a leak? Should you re-roof or just repair? Find out exactly what is wet or dry under your roof surface with this non-invasive, non-destructive testing solution. We have the ability to see underneath your roof with an Infrared camera and determine if you have wet insulation, moisture problems, energy loss, etc. by scanning your roof surface after sunset.

Our clients have benefitted greatly from this service, saving hundreds of thousands of dollars when re-roofing, by re-using dry insulation that is in good condition, instead of sending it to the landfill.
